1936

INTRODUCTION

The Fifth Bulletin of North Carolina Morbidity Statistics, covering the calendar year 1936 and containing tabulations similar to those appearing in previous Bulletins, is herewith presented at a date earlier than ever before since these Bulletins have been issued.

Unlike the Fourth Morbidity Bulletin for the year 1935, which contained a statistical record of the poliomyelitis epidemic in North Carolina during that year, this Bulletin does not record any disease incidence of epidemic proportions for the year 1936. There were reported in 1936 only 52 cases of poliomyelitis as compared with the 675 cases of that disease reported in 1935.

There was a slight decrease in the number of typhoid fever cases (518) reported in 1936 as compared with the number (645) reported in 1935. While this is encouraging, it is not considered sufficient to justify any lessening of efforts to promote control measures.

In 1936 there were reported 2347 cases of diphtheria as compared with 1720 cases reported in 1935 and 2497 in 1934. It is apparent that the State as a whole has not taken full advantage of the procedures available for the prevention of this disease. Renewed efforts toward that goal are indicated for the future.

It is felt that the decided rise in reported cases of tuberculosis in 1936 (3008) over the number (1996) reported in 1935 is evidence that reporting is more thorough over the State than it has been previously. At the present time approximately two cases of tuberculosis are reported for each recorded death from the same cause, and we hope for still further improvement in reporting.

In 1936 reporting by physicians in North Carolina was 3.8 per cent better than in 1935. The number of counties reporting cases was the same as in 1935.

Attention is directed to the total of 6086 syphilis cases reported in 1936 as compared with 5189 reported in 1935. The 1936 total reported exceeds by 885 cases the total cases reported during any year since reporting began in North Carolina in 1918. We expect the aroused public interest in venereal disease control to continue to reflect itself in more thorough reporting of such cases to this Department.

INTRODUCTION

The Fifth Bulletin of North Carolina Morbidity Statistics covering the calendar year 1936 and containing tabulations similar to those appearing in previous bulletins is herewith presented at a date earlier than ever before since these Bulletins have been issued.

Unlike the Fourth Morbidity Bulletin for the year 1935, which contained a statistical record of the poliomyelitis epidemic in North Carolina during that year, this Bulletin does not record any disease incidence of epidemic proportions for the year 1936. There were reported in 1936 only 52 cases of poliomyelitis as compared with the 675 cases of that disease reported in 1935.

There was a slight decrease in the number of typhoid fever cases (518) reported in 1936 as compared with the number (649) reported in 1935. While this is encouraging, it is not considered sufficient to justify any lessening of efforts to promote control measures.

In 1936 there were reported 2347 cases of diphtheria as compared with 1720 cases reported in 1935 and 2497 in 1934. It is apparent that the State as a whole has not taken full advantage of the procedures available for the prevention of this disease. Renewed efforts toward that goal are indicated for the future.

It is felt that the decided rise in reported cases of tuberculosis in 1936 (3032) over the number (2996) reported in 1935 is evidence that reporting is more thorough over the State than it has been previously. At the present time approximately two cases of tuberculosis are reported for each recorded death from the same cause, and we hope for still further improvement in reporting.

In 1936 reporting by physicians in North Carolina was 7.8 per cent better than in 1935. The number of counties reporting cases was the same as in 1935.

Attention is directed to the total of 6086 syphilis cases reported in 1936 as compared with 5189 reported in 1935. The 1936 total reported exceeds by 845 cases the total cases reported during any year since reporting began in North Carolina in 1918. We expect the aroused public interest in venereal disease control to continue to reflect itself in more thorough reporting of such cases to this Department.
